

The MATRIX-System

Form Adapting Support Technique

Profile Systems / Fixture Systems

The Stability

Short assembly time, easy accessibility.

Top priority in the arrangement of the fixture is to have easy accessibility to the work piece during measurement.

The construction of the profiles optimizes weight and stability with a uniform groove width. The profiles are quickly connected with anchors and screws. All accessories fit into all of the profile dimensions.

Infinite Adjustment

The distance between the vertical supports can be changed by shifting the carriage in the X-, Y- and Z-axis.

Due to the high flexibility of the system, it can react to problem-specific measurement tasks in automobile body, door and trunk construction.
